Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

Site-specific recombination; bacterial attachment site; plasmid; vaccine; gene therapy; ss. A new expression cassette consists of a gene of interest controlled by a promoter and terminator functional in mammalian cells and is flanked by sequences in direct orientation which allow site-specific recombination. Lambda attp and attB sites specific recombination are the bacteriophage phage lambda. The expression cassettes can be used for producing plasmids which are useful in vaccination or for genetic/callular therapy, e.g. of amyotrophic lateral sclerosis; Alzheimer's or Parkinson's diseases, Plasmids capable of site-specific recombination - useful for vaccination and in gene therapy. coagulation/dyslipoproteinaemia or viral infections (AIDS or hepatitis) Wils P; Sequence 21 BP; 4 A; 4 C; 2 G; 11 T; 0 U; 0 Other; Darquet A, Scherman D, Claim 17; Page 43; 81pp; French. The invention describes producing a collection of responder cells for high throughput screening assays, by identifying and cloning regulatory regions into expression constructs to control nucleic acids, and introducing the constructs into addressable cells. The method is useful introducing the constructs into addressable cells. The method is useful in producing cells used in high throughput screening assays for profiling substances and conditions and for studying the function of the regulatory trepton mediating the response. The cells serve as biosensors to assess the effects of any perturbation, such as external or internal condition, on the cells from which the regulatory regions in the reporter gene constructs are derived can be inferred. This sequence represents a constructs of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing a collection of responder cells for high throughput screening assays, comprises identifying and cloning regulatory regions into expression constructs to control nucleic acids, and introducing into

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel sequence-specific recombination (SSR) of DNA in a eukaryotic cell, comprising introducing two DNA sequences (I, II) into a cell, using an integrase (Int) to effect SSR. The invention also describes (I) a muclaic acid comprising a 243 base pair sequence (III), fully defined in the specification, or its derivatives; and (2) vector containing (III), or its derivatives plus a therapeutic gene, or its derivatives. The method is particularly used in somatic gene therapy in humans anaimals, but can be applied more generally for gene transfer to animal or plant cells. The method is simple and controllable, and provides stable and targeted integration of selected DNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence-specific recombination of DNA in eukaryotes, useful particularly for somatic cell gene therapy, uses an integrase to effect recombination between att sites.

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of chromosome. Also described: (I) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform artificial chromosome, preferably an Aces. (II) is useful for producing cransgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection, microphosometror of direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for an embryonic nucleic acid that encodes a therapeutic product which is useful for an embryonic nucleic acid that encodes a therapeutic product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0;

The invention relates to novel methods for cloning or subcloning one or more nucleic acid molecules (NAMS) comprising: (a) combining in vitro or in vivo: (1) at least one insert donor molecules (IDMS) comprising one or more desired nucleic acid segments flanked by at least 2 recombination sites which do not recombine with each other; (2) one or more vector con an enclecules (VDMS) comprising at least 2 recombination sites which do not recombine with each other; and (3) one or more site-specific not recombination proteins; (b) incubating the combination to transfer one or more of the desired segments into one or more of the VDMS, thereby producing one or more desired product molecules (PMS). The methods can be used for the efficient and specific recombination of NAM segments. They desired characteristics and/or nucleic acid segments. The methods can also be used for changing vectors. The oligonucleotides AAX78935-X78994 are used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attP1, attB2, attL1, attL2, attB1, and attB2 nucleotide sequence. Also described are: (I) an isolated mucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination sites acond att recombination sites, and (2) an isolated mucleic acid molecule (III) comprising one or more mutated att recombination sites one mutated att recombination site and a second nucleic acid molecule comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising at second recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated can recombinate to site and a second mucleic acid molecules. They can be used for changing vectors and methods from the present invention are used for the recombinational cloning of art recombination are used for the recombinational cloning of an uncleic acid molecules. They can be used for changing vectors, targeting desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning (1), (III), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0
Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attL1, attL2, attL1, and attR2 nucleotide sequence useful for the recombinational cloning of polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  primer attB0 used to produce a population of hybrid DNA molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bacteriophage lambda; recombination; att site; PCR primer; lambda Int;

                                                                                                                                                                                                                                                                            AASO6174-AASO6322 represent Bacteriophage lambda att recombination site nucleic acid sequences, and PCR primers of the invention. The att sequences are recognised by the recombination protein lambda integrases (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising one or method of producing a population of hybrid acids comprising one or more recombination sites with at least one target nucleic acid comprising one or more recombination sites and causing some or all of the nucleic acids to recombine with all or some of the target nucleic acids. The method is useful for producing a population of hybrid nucleic acids which may be the same or different. The nucleic acids may be used to express therapeutic proteins or peptides and they may also be used to express therapeutic proteins or peptides and they may also be used to each other. The method allows simultaneous cloning of two or more different nucleic acids
                                                   Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank a selectable marker and comprise a core region having an engineered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Core region, recombination site; cloning; chimeric DNA; PCR primer; characteristic; mutation; att site; lox site; phoA gene; ss.

Comprising a first nucleic acid sequence having a defined sequence (IAC87866 to AAC87881).

CAMC87866 to AAC87881, sequences complementary to AAC87866 to AAC87881, or an RNA sequence corresponding to AAC87866 to AAC87861. Also described are: (1) an isolated nucleic acid molecule (II) comprising a first mutated recombination site that removes one or more stop codons from the recombination site; (2) an isolated nucleic acid molecule (III) comprising a first at recombination site or avoids hairpin for mutated molecule (III) and to rose second molecule (III) comprising a first att recombination site comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids or (IV). The nucleic acids are used in engineering a core region of a given recombination site to provide mutative sites suitable for subcloning reactions. The use of nucleic acids for obtaining consineered recombination in vitro or in vivo makes the methods for DNA or RNA subcloning, highly specific, rapid, and less labour intensive. The present sequence represents an E. coli atts oligonuclectide, which is used in an example from the present invention The present invention describes an isolated nucleic acid molecule (I) %XGGGGGGGGGGGGGGGGGG

Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank a selectable marker and comprise a core region having an engineered mutation.

Example 3; Col 24; 73pp; English.

The present invention describes an isolated nucleic acid molecule (1) comprising a first nucleic acid sequence having a defined sequence (AAC87866 to AAC87881, sequences complementary to AAC87866 to AAC87881, or an RNA sequence corresponding to AAC87866 to AAC87881. Also described are: (1) an isolated nucleic acid molecule (II) comprising a first

ó recombination site or avoids hairpin formation, the recombination site or avoids hairpin formation, the recombination site or avoids hairpin formation, the recombination site comprising a direct att recombination site comprising a mutation that enhances recombination specificity; (3) vectors (IV) comprising the above mentioned nucleic acids, and (4) cells comprising the above mentioned nucleic acids or (IV). The nucleic acids are used in engineering a corregion of a given recombination site to provide mutative sites suitable for subcloning reactions. The use of nucleic acids for obtaining nearest encombination in vitro or in vivo makes the methods for DNA or RNA subcloning, highly specific, rapid, and less labour intensive. The present sequence represents an E. coli attB oligonucleotide, which is mutated recombination site that removes one or more stop codons from the Gaps 0; 100.0%; Score 21; DB 4; Length 25; 100.0%; Pred. The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors each comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chiercir nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid molecule, and selecting against a host comprising the vectors comprising the second vector; to clone the nucleic acid. The present sequence is a recombinantion site, which may be used in the method of the present In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host. The invention relates to a method for apposing an expression signal and a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression signal and the gene/ partial gene in the presence of a recombination protein under conditions sufficient to cause recombination and therefore appose the expression signal and the gene or partial gene. The methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are also useful for changing vectors, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages, and cloning e.g., PCR products (with an attB site at one end and a loxe site at the other end), genomic DNAs, and cDNAs. The methods are highly specific, rapid, and less labour intensive than prior art methods. The present sequence is a recombination site useful for recombination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Methods for apposing nucleic acids comprising an expression signal and a gene/partial gene, using recombinatorial cloning by incubating the nucleic acids in the presence of a recombination protein under conditions for recombination.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors each comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid molecule, and selecting against a host comprising the vectors comprising the second vector, to clone the nucleic acid. The present sequence is a PCR primer used in the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                The invention relates to a vector donor DNA molecule comprising a first DNA segment and a second DNA segment containing at least one selectable marker. The first and second segments are separated either by, in a circular vector donor, a first and a second recombination site, or in a linear vector donor, at least a first recombination site, where each pair of flanking recombination sites are engineered and do not recombine with each other. The nucleic acid molecule, vectors and methods are useful for moving or exchanging segments of DNA molecules using engineered recombination sites and recombination proteins to provide chimeric DNA molecules that have the desired characteristic(s) and/or DNA segment(s).
                                                                                                                                                                                        New Vector Donor DNA molecule for recombinational cloning using engineered recombination sites, comprises first and second DNA segments that do not recombine with each other and that contain a Selectable

```
The invention relates to a vector donor DNA molecule comprising a first DNA segment and a second DNA segment containing at least one selectable marker. The first and second segments are separated either by, in a circular vector donor, a first and a second recombination site, or in a linear vector donor, at least a first recombination site, where each pair of flanking recombinatic sites are engineered and do not recombine each other. The nucleic acid molecule, vectors and methods are useful for moving or exchanging segments of DNA molecules using engineered
                                                                                                                                                                                  sedments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           recombination sites and recombination proteins to provide chimeric DNA molecules that have the desired characteristic(s) and/or DNA segment(s) The present sequence represents the engineered recombination site

XX
The invention relates to a method of making a cointegrate DNA molecule.
CC The method is useful for making a cointegrate DNA molecule. The method is useful for a variety of DNA exchanges, such as subcloning of DNA, in
CC the CDNA segments using recombination proteins. The method is highly
CC vitro or in vivo. The method enables efficient and specific recombination
CC view of DNA segments using recombination proteins. The method is highly
CC yield and speed of the method facilitates DNA or RNA subcloning,
CC yield and speed of the method facilitates DNA or RNA subcloning,
CC yield and schange useful for other related purposes. Since single
CC molecules of the recombinations product can be introduced into a
CC biological host, propagation of the desired product DNA in the absence of
CC other DNA molecules is more readily realised. Reaction conditions can be
CC sequence represents the wild type attl and attr site recombination

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 32,

Sequence 78, Application US/08556978B

Patent No. 6268169

GENERAL INPORMATION:
APPLICANT: FARNESTOCK, STEPHEN F.
TITLE OF INVENTION: SPIDER SILK ANALOGS
INUMERS OF SEQUENCES: 107

CORRESPONDENCE ADDRESS:
ADDRESSEE: E. I. DU PONT DE NEMOURS AND COMPANY
CITY: WITTED OF INVENTION: SPIDER SILK ANALOGS
INUMERS OF SEQUENCES: 107

CORRESPONDENCE ADDRESS:
ADDRESSEE: E. I. DU PONT DE NEMOURS AND COMPANY
CITY: WITTED STATES OF AMERICA
ILMINITON MARKET STREET
CONFITY: UNITED STATES OF AMERICA
ILMIN TYPE: DISKETTE, 3.50 INCH
COMPUTER READABLE PORM:
MEDIUM TYPE: DISKETTE, 3.50 INCH
COMPUTER READABLE PORM:
METABORICATION DATA:
APPLICATION NUMBER: US/08/556,978B
FILING DATE: 1993
ATTORNEY/AGENT INFORMATION:
APPLICATION NUMBER: 31,692
ATTORNEY/AGENT INFORMATION:
APPLICATION NUMBER: 33,692
FILING DATE: JUNE 15, 1993
ATTORNEY/AGENT INFORMATION:
TELEPRAX: 302-992-8112
TELEPRAX: 302-992-8112
TELEPRAX: 302-992-8112
